Project Category	Mobile Application
University	The Islamia University of Bahawalpur

1. Project Title

BookLoop: An Online Platform for Affordable Books through Resale and Exchange

2. Project Brief

BookLoop is a mobile application designed to help students and readers find affordable books by connecting people who have books they no longer need with people who want to buy or exchange them. Users can list new or used books with details such as title, author, category, condition, price, and location. Other users can search and filter listings, view book details, and send purchase or exchange requests. The initial focus is on school textbooks, college books, and university study books, while allowing other book categories as well.

3. Problem Statement

Many students cannot easily afford new textbooks, while useful books often remain unused in homes after a course or academic year ends. Finding a suitable used book can depend on personal contacts or visiting multiple shops. BookLoop aims to make book discovery easier and more affordable through a searchable, location-aware listing platform.

4. Main Objectives

• Help students find books at lower prices.
• Allow users to sell, exchange, or list books they no longer need.
• Make book search easier using title, category, price, condition, and location filters.
• Maintain clear listing and request statuses to support organized transactions.

5. Proposed Features

• User registration and login.
• Seller profile and book listing with photos and details.
• Search and filters by title, category, class/level, price, condition, and location.
• Book details page with seller-provided information.
• Purchase or exchange request submission.
• Request status and basic order history.
• Optional bookstore pickup/delivery coordination, only if a partner agrees.
• Admin tools to review reports and remove misleading or inappropriate listings.

6. Technologies

Technology	Purpose
Flutter	Build the Android mobile application interface.
Firebase Authentication	User registration and login.
Cloud Firestore	Store user profiles, book listings, requests, and statuses.
Firebase Storage	Store uploaded book photographs.
Figma (optional)	Design and prototype the app screens before development.

7. Target Users

School, college, and university students; parents; general readers; and people or local bookstores that want to resell or exchange books.

8. Project Scope

The first version will focus on book listings, search, filters, and purchase/exchange requests. Real payment processing and delivery integration are not required for the initial academic prototype; requests can be confirmed manually. Any bookstore partnership would depend on prior agreement.

9. Expected Outcome

A working mobile-app prototype that makes it easier to discover affordable new and used books, helps reusable books reach new readers, and organizes listing and request information in one place.

10. Important Considerations

The app should clearly label new and used books, encourage accurate descriptions and photos, and define how users contact each other and arrange payment, collection, or delivery. User contact information should be protected, and reported listings should be reviewable by an administrator.

Prepared for discussion and approval by the project supervisor.
